

Project Description

This project analyzes a simulated retail sales dataset containing daily trading information for a single product sold by a large retail store. The objective is to transform raw sales data into meaningful business insights by exploring sales performance, pricing trends, profitability, and customer demand.

The project follows a complete data analytics workflow, including data exploration, data cleaning, feature engineering, SQL analysis, metric development, dashboard creation, and business reporting. Key metrics such as Sales Price per Unit, Gross Profit, Gross Profit Percentage, and Price Elasticity of Demand were calculated to evaluate product performance and the impact of promotional pricing.

An interactive dashboard was developed to visualize sales trends, profitability, pricing patterns, and promotional performance. The final output provides actionable insights and recommendations to support data-driven decision-making, improve pricing strategies, optimize promotions, and enhance overall business performance.
